

Why to use .gitignore files in project

.gitignore tells Git: "Don't track these files. Don't show them in `git status`. Don't include them in commits."

.gitignore solves all of this by saying "Git, only track *source code*, not generated junk."

Basic for visual studio:

```
# Build outputs
[Bb]in/
[Oo]bj/

# Visual Studio user files
.vs/
*.user
*.suo

# Publish outputs
[Pp]ublish/
*.pubxml.user

# NuGet
*.nupkg

# Secrets
*.env
appsettings.*.Local.json
secrets.json

# Logs
*.log

# OS
Thumbs.db
.DS_Store
```

Quick Why	
Entry	Reason
bin/, obj/	Compile outputs – regenerated every build
.vs/, *.user, *.suo	Your personal IDE state
publish/, *.pubxml.user	Build artifacts; user file holds credentials
*.nupkg	NuGet package files
.env, appsettings..Local.json, secrets.json	Never commit secrets
*.log	Runtime noise
Thumbs.db, .DS_Store	OS junk
